EXECUTIVE BRIEF | SENIOR HOUSING & ASSISTED LIVING COMMUNITIES

A Network as Dependable as the Care You Provide

Secure, AI-driven, autonomous connectivity, delivered as-a-service across every community you operate.

Senior living has become one of the most targeted sectors in cybersecurity. The intrusions rarely start on the network, they start with one stolen login on an open, flat network where a single identity can reach eMAR, resident PHI, and the accounts that hold resident funds. At the same time, residents and families judge a community by how reliably its Wi-Fi, streaming, and telehealth simply work.

100s
COMMUNITIES STANDARDIZED ON ONE AI-MANAGED FABRIC

The legacy network: high cost, high risk

- Dozens of boxes per community, multiplied across every community, mean capital spikes every refresh.
- Security bolted on; one compromised TV, camera, or guest device reaches clinical & financial systems.
- Manual ops with little on-site IT; outages, slow repair, no performance accountability.
- Every community and every acquisition is different. No standardization, harder audits, costlier insurance.

Nile Secure Network-as-a-Service

- **One subscription:** APs, switches, sensors, AI ops, and security; no NAC/RADIUS/DHCP to manage.
- **Zero Trust by default:** every device in a “segment of one” so a breach can’t spread.
- **Run by AI:** predictive uptime, automatic containment, autonomous day-to-day operations.
- **Capital → predictable opex**, lifecycle included, backed by a financial performance guarantee.

Value for every stakeholder

CEO / COO | CFO | CIO / IT | Clinical | Risk

Zero Compromise
Resident experience & standardization

Zero CapEx
Predictable opex, cleaner forecasting

Zero Touch
Lean, simplified multicommunity ops

Zero Disruption
Uptime for connected care

Zero Blind Spots
Audit-ready by design

What it delivers on the ground

- Med pass administration, nurse call & telehealth that **keep running** through an incident
- Reliable community-wide Wi-Fi that **drives satisfaction and occupancy**
- Medical & building IoT **isolated** so a bad endpoint can't reach PHI or funds
- **A smaller ransomware blast radius** and cleaner HIPAA, PCI & state audits
- New communities & acquisitions **online in days**, not quarters
- Threats caught in **seconds**, not in a months-long post-mortem

Start with a posture assessment, not a hardware diagram.

Nile maps your current wired, wireless & security posture to clinical, hospitality, compliance, and multi-community requirements, with a clear business case for transition.
